## LIST OFFICERS

PRES. HARVEY RAIT  
TRES. ROBERT MALLOY  
REC. SEC. STEVE KAYE  
EDITOR. FRED STERN  
LIBR. TOM SKAPINSKI

PLEASE SEND INQUIRIES TO:

LIST  
MR. HARVEY RAIT  
5 PERI LANE  
VALLEY STREAM, N.Y. 11581

PLEASE SEND SUBMISSIONS TO:

LISTING  
MR. FREDERIC STERN  
214 ROBERTS ST.  
HOLBROOK, N.Y. 11741

## NYTSE

NYTSE MEETS THE MONDAY AFTER  
THE LIST MEETING AT:  
MISS KIMS RESTAURANT  
PARK AVENUE SOUTH  
BETWEEN 21 ST. AND 22 ST.  
MEETINGS START 7:30 PM.

## COMING EVENTS:

MAY 20, 1990 LIST MEETING  
MAY 21, 1990 NYTSE MEETING

MEETING MINUTES  
APRIL 20, 1990

THIS IS THE FIRST MEETING HELD  
AT THE WOODBURY NURSING HOME.

HARVEY CALLED THE MEETING TO  
ORDER AT 2:15 PM.

HARVEY AND FRED READ LETTERS  
RECEIVED SINCE THE LAST MEETING.  
WE WELCOME 3 NEW MEMBERS;  
WILLIE ROLDAN, BRONX N.Y.  
MARK AND MARY YOST, CANTON CT.

HELP WANTED, HELP WANTED,

FRED STERN HAS BEEN ANSWERING  
LETTERS TO LIST AND EDITING THE  
NEWSLETTER. WE NEED A MEMBER TO  
TAKE OVER ANSWERING THE  
CORRESPONDENCE.  
FRED WILL CONTINUE THE JOB UNTIL  
THE SUMMER BREAK.  
INTERESTED MEMBERS CAN CONTACT  
EITHER FRED OR HARVEY.

NEWS, NEWS, NEWS, NEWS, NEWS,

WE RECEIVED A FLYER FROM BUDGET  
ROBOTICS, TUCSON AZ. BUDGET IS  
SELLING PARTS AND PERIPHERALS  
FOR THE ZX-81 AND TS1000. OF  
INTEREST ALSO IS AN AD FOR ZX-81  
KITS THROUGH ZEBRA SYSTEMS FOR  
\$49.95.

MAR/APR 90 SINCUS REPORTS THAT  
E. ARTHUR BROWN HAS AN AD ALSO  
FOR THE ZX-81 KIT FOR \$39.95.

## DEMONSTRATION

JIM DOUCAS AND BOB GILDER  
DEMONSTRATED NETWORKING USING  
2 OR MORE QL COMPUTERS. JIM  
EXPLAINED THAT TWO PROGRAMS ARE  
REQUIRED TO GET THE SYSTEM GOING  
NETWORK ON TOOL KIT IS THE PRIME  
PROGRAM, BUT E-SERVE IS ALSO  
NEEDED TO CORRECT FAULTS IN THE  
NET PROGRAM.

I HOPE JIM OR BOB WRITE AN  
ARTICLE FOR LISTING TO BETTER  
EXPLAIN THE SOFTWARE AND HOOKUP.

## COMING EVENTS

OUR NEXT MEETING WILL AGAIN BE  
HELD AT THE:  
WOODBURY NURSING HOME  
8533 JERICHO TURNPIKE  
WOODBURY N.Y.

OUR JUNE 10, 1990 MEETING AND  
SWAPMEET WILL BE AT HARVEYS  
HOUSE IN VALLEY STREAM.

## SPECIAL THANK YOU

\*\*\*\*\*  
TO MS. KIM GIDIA AND THE STAFF  
OF THE WOODBURY NURSING HOME  
FOR THERE HOSPITALITY AND  
EFFORTS TO MAKE OUR MEETING A  
GREAT SUCCESS.

## CLASSIFIEDS

THIS CLASSIFIED SECTION IS  
AVAILABLE TO ALL LIST MEMBERS  
FREE OF CHARGE.  
THE ONLY RESTRICTION IS THAT  
IT IS TO BE USED ONLY FOR THE  
SEEKING, SELLING OR SWAPPING  
OF SINCLAIR, TIMEX OR MICROACE  
COMPUTER EQUIPMENT, PERIPHERALS  
AND SOFTWARE.  
LISTING, LIST, AND ITS OFFICERS  
DO NOT ENDORSE, WARRANTY, OR  
GUARANTEE ANY OF THE ITEMS  
LISTED IN THIS CLASSIFIED  
SECTION

IF YOU HAVE A COPY OF Q-SAVE,  
FOR THE TS1000 PLEASE CONTACT  
FRED STERN 516-737-0963.

## A FINAL WORD

MY NAME IS FRED STERN AND I AM  
THE EDITOR OF THIS EDITION OF  
LISTING.

THANK YOUS GO TO TOM SKAPINSKI  
FOR HIS ASSISTANCE.

ENCLOSED IN THIS ISSUE IS A  
PARTIAL LIST OF OUR MEMBERSHIP.  
NAMES AND ADDRESSES OF MANY  
MEMBERS WERE NOT INCLUDED BY THE  
MEMBERS REQUEST.

THE NOTICE OF THE KEN GORDON  
SHOW MENTIONED IN THE LAST  
NEWSLETTER WAS DELETED BEFORE  
GOING TO PRINT FOR OBVIOUS  
REASONS. SORRY FOR ANY  
INCONVENIENCES.  
SEE YOU ALL AT THE NEXT MEETING.

# TRY THIS

## A Cheap and Simple EPROM Programmer

Dan Schaaf

"What more could I want?" That's what you usually say before you buy something. But you learn after you have had it for a while that there is a lot more to be wanted. Past

Dan Schaaf, 306 N. Carroll, Michigan City, IN 46360.

issues of *SYNC* have had several articles to remedy heart-felt deficiencies in the Sinclair Basics: SCROLLs, PAUSEs, READs, DATAs, string handling routines, etc.

This article will show you how to build an add-on device which will allow you to have any of these routines, plus any you can design yourself, permanently and instantly available to you in one 4K EPROM without the need to

LOAD those routines from tape into the machine (a waste of time and of RAM). Those interested in peripherals for the Sinclairs (floppy disk, electronic typewriters, etc.) can design monitors and controllers for those devices. Eventually you can program independent microprocessors for special purposes. An EPROM programmer can become a real liberator of the power inherent in the Z80.

4K EPROMs now cost less than \$10.00. 4K was chosen because of its cost advantage and simplicity of programming. 4K is a good healthy chunk of memory as witnessed by the

Figure 1. Schematic Diagram.

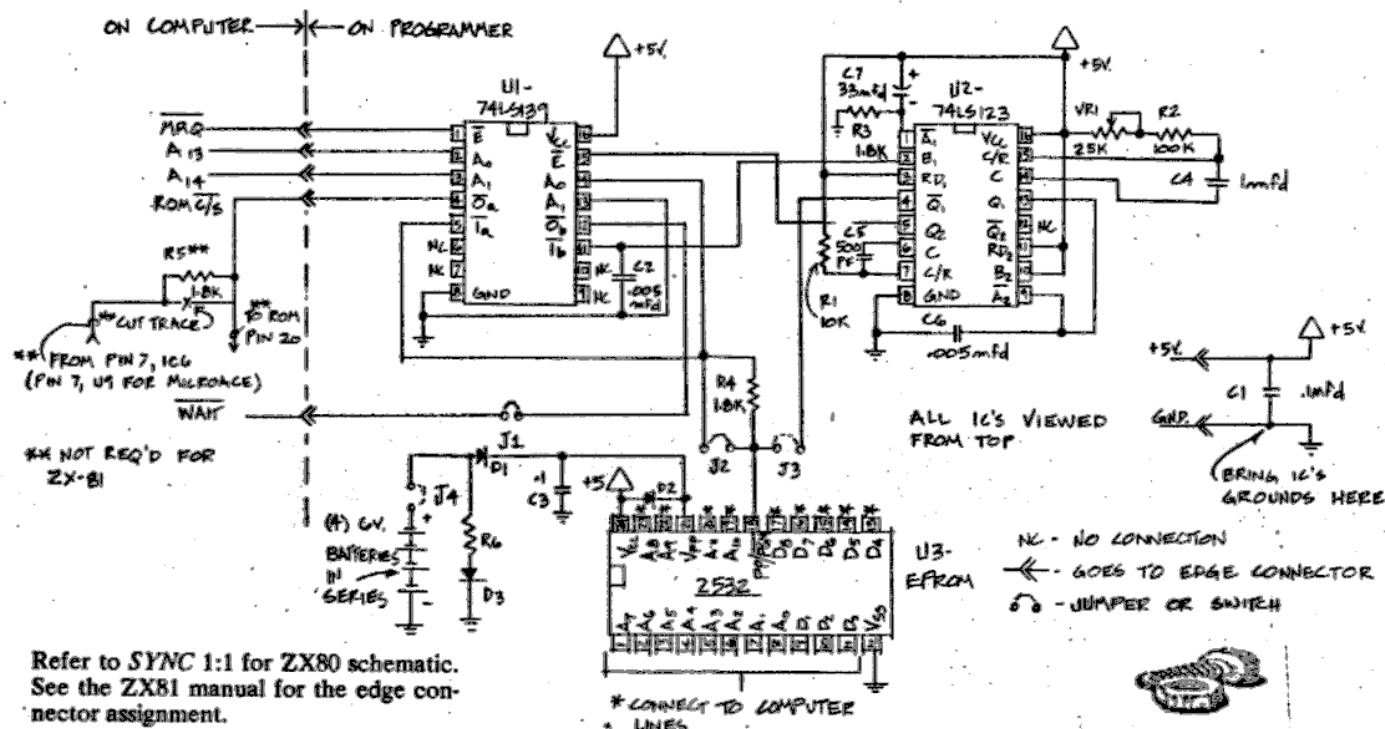

Figure 2. Timing Diagram

The diagram illustrates the timing of a microcontroller's data/address bus and the PD/PWM signal. The data/address bus is labeled "DATA & ADDRESS IN". The PD/PWM signal is shown as a square wave. The timing is defined by several key points:

- START "WAIT"**: The point where the PD/PWM signal transitions from high to low.
- STOP 1st MONO**: The point where the PD/PWM signal transitions from low to high.
- START SECOND MONO**: The point where the PD/PWM signal transitions from high to low again.
- END "WAIT" STATE**: The point where the PD/PWM signal transitions from low to high.
- 24μs (MON)**: The duration of the "MONO" (monitor) state, indicated by two horizontal arrows.
- 50ms**: The duration of the "WAIT" state, indicated by a horizontal arrow.

A large question mark is drawn on the left side of the diagram, indicating a point of confusion or a question about the timing.

[illegible]

the 50 ms pulse to the PD/PGM pin is delayed 2  $\mu$ s (capacitor C2). 2  $\mu$ s (capacitor C6) after the 50 ms pulse ends, a 4  $\mu$ s pulse from the second mono clears the Wait state and allows the computer's bus lines to operate as normal.

2) Data is retained when the power is turned off, almost forever.

Once built, programming proceeds by POKEing data into the proper addresses. USR is then used if the data was a machine language program, or PEEK if the data was a table, and also PEEK to check that programming worked properly.

**EPROM** stands for Erasable Programmable Read Only Memory. An EPROM has some of the same characteristics as the ROM in your machine that contains the Basic language:

## How Does an EPROM Work?

The basic element of the EPROM is a capacitor which holds a charge. The estimated life time (time constant) of the charge is 7 to 10 years. Each bit is represented within the EPROM by one capacitor. A sensing amplifier converts this static charge to a TTL

## How the EPROM Programmer Works

Looking at the data sheets for the EPROM selected, one sees various requirements:

- 1) Data and address information must be at TTL compatible voltages.
- 2) For programming, 25 volts must be applied to pin 21 ( $V_{pp}$ ).
- 3) Data and addresses must be held constant for 50 milli-seconds.
- 4) A certain timing sequence must be carried out with regards to the activation of the programming pin, pin 18 (See Timing Diagram.)

1) and 2) are easily met. The Z80 has TTL compatible voltage levels and four 6 volt batteries will provide 25 volts. 3) and 4) are harder to meet. A POKE command only holds address and data information on the busses for about 550 nanoseconds, almost 100,000 times too short for proper EPROM programming.

The solution is to use the WAIT pin on the Z80. When the WAIT pin is active (low voltage) all bus information is held constant until the pin voltage goes high again. The circuit shown has a one-shot whose time period is set to 50 microseconds. The other timing requirements are taken care of by the circuit as well, as explained next.

When the EPROM is addressed (a proper combination of A13, A14, and  $\overline{\text{MRQ}}$ , memory request) by the Z80, U1 switches the internal ROM off (via  $\overline{\text{O}}_{\text{a}}$ -pin 4) and turns on the EPROM (via  $\overline{\text{I}}_{\text{a}}$ -pin 5). If J1 is in, a  $\overline{\text{WAIT}}$  state is started when  $\overline{\text{O}}_{\text{b}}$  pin 12 of U1 goes low. At the same time, pin 11  $\overline{\text{I}}_{\text{b}}$  of U1 goes high initiating the 50 millisecond one-shot of U2 (VR1 + R2, C4). Q1 of U2 goes low for 50 milliseconds as does PGM, pin 18 of U3, which then programs the EPROM. 2 milliseconds after the end of the 50 millisecond programming period, the second one-shot of U2 (R1, C5) disables the Enable pin, pin 15, of U1 thus clearing the  $\overline{\text{WAIT}}$  state and allowing the computer to process the next instruction.

The design was such as to use a minimum of parts. Certain problems therefore exist which can be avoided by being aware of them. The main concern is that a PEEK command, or USR command into the EPROM when the EPROM is in the "program" mode will write useless data into the EPROM. Therefore, *do not* PEEK or USR into the EPROM without disconnecting the 25 volts (J4 out).

If you are familiar with dynamic RAM specifications (the type of RAM used in the 16K-64K expansion units), you will know that they specify a maximum refresh period usually of 2 milliseconds. During a WAIT cycle there is no refreshing. So if the data sheets are to be believed, dynamic RAMs should not work with this EPROMer. However, I have found that dynamic RAMs can tolerate as much as one or two seconds without refresh and without loss of data. I have used my EPROM programmer with 16K and the newer 64K dynamic RAMs and have had no troubles. If you run into trouble, disconnect the dynamic RAMs and use the internal static RAMs, which need no refresh.

### Making It

The construction method described here is the one I used and may not be best for you.

What I usually do is lay out the ICs (or IC sockets) on a board, making sure that there is enough room for miscellaneous components and that the wiring which will interface with the computer is conveniently close to the edge of the board. I seek to minimize runs, especially power runs (5 and 25 volt). I then put in the other components and use the leads as much as possible to wire the circuit. Every step of the way I check and double check that my wiring corresponds to the schematic. ICs get confusing since you must look at them from the top and the bottom. (See schematic.)

Many years ago I got a lot of color-coded telephone wire (what more could I want?) from an abandoned factory in my home town.

I use that to wire the rest of the circuit. I recheck the circuit against the schematic and then solder all the points. After that I use a Volt-Ohm Meter to test the continuity of each run as well as that two runs have not accidentally shorted. Good, clean, logical construction habits save hours of needless trouble shooting later. I try to document what and how I have wired it after I am done.

So now you have a board wired as in the schematic. Next it must be interfaced with the computer. Here again I used a method which may not be right for you. Any method is acceptable, including hardwiring it with color coded telephone wire. However, this could limit future expansion. AP Products (as shown on page 42 of the 1982 Jameco Cata-

log) has jumper headers and cable assemblies which can be used. I used two straight double row, 40 post jumper headers. One set I soldered onto the EPROM board. The other set I soldered onto the computer's edge connector lower forty.

I then interconnected the two boards with a 6" AP flat ribbon cable. Long runs of data lines can cause problems and should be avoided. Of the four remaining edge connector positions, only two are needed: D7 and 5 + volts. These I hard wired with a connector in between for disconnecting.

The EPROM is a MOS device and is susceptible to damage due to static discharge. I have not been overly cautious, yet I have never had trouble with static charge destroying a

Connector Cable - (See article "Making It")		

\* The other IC's can be soldered into place without too much fear of damage or having to replace them. But the EPROM, and any MOS device, really should be in a socket.

\*\* Available through many mail order houses, such as Jameco, Active Electronics, JDR Microdevices, etc., Addresses and prices can be found in the back of most hobby electronics magazines.

Program 1.

```

10 FOR L=0 TO 255
20 POKE 18000,L
30 NEXT L

```

Program 2.

```

10 FOR L=0 TO 4095
20 IF PEEK (L+18000) < 255 THEN
PRINT L, PEEK (L+18000)
30 NEXT L

```

Program 3.

```

5 IF INKEY$ < "P" THEN GOTO 5
10 POKE 18000,0
20 POKE 18000,0
30 GOTO 20

```

Program 4.

SAME AS PROGRAM 2

Program 5.

```

5 IF NOT INKEY$="P" THEN GOTO 5
10 POKE M,N1
20 POKE M+1,N2
30 POKE M+2,N3
: (REST OF MACHINE LANGUAGE PROGRAM)
1000 SAVE "P"
1010 GOTO 1000

```

Note: M = first address at which the data is to be put. N1, etc. is the data.

MOS device. One should, however, make sure before handling the EPROM that you are discharged to the ground of the computer board. Do not place EPROM into socket until both the timing and the 25v circuit have been checked out.

In making the EPROM programmer I ran into difficulties. The main one was that the EPROM pin (address 7) was defective and only one half of the memory was addressable. At first I assumed that my circuit was in error. After several days I convinced myself that the EPROM was bad and returned it for exchange and bought another chip as well. The exchanged chip had the same problem while the new chip appears to be working fine. (I also accidentally applied 25v to the 5v supply which fried 2 RAMS but in the process fortunately spared the rest of the computer.)

### Trouble Shooting Before Putting the EPROM In

In SYNC (2:1) I showed a method of monitoring computer activities by injecting signals into the video output. This method is useful in dynamically testing the board and connection to the computer. With the computer on and the board connected, note the different patterns that the pins on the Z80 make relevant to the EPROM. For instance, the patterns for A<sub>0</sub> at the edge connector should be the same as A<sub>0</sub> at the EPROM.

### Program 6. A Machine Language Program to be POKEd into the EPROM.

```
LD HL (E-file)      ; Load HL with E-file location the end
                     ; of the variables list. A string must
                     ; be at the end of that list.

25-254	26-16	27-56	28-2	29-207
30-9	31-79	32-9	33-24	34-233

Chart 1.

MODE:	J1	J2	J3	J4
Test	in	out	in	out
Program	in	out	in	in
Read	out	in	out	out

Chart 2. Memory Locations.

The microprocessor starts at zero and proceeds up in addresses, doing each instruction in turn until it eventually loops back to a lower address.

Repeat for A<sub>0</sub> to A<sub>11</sub> and D<sub>0</sub> to D<sub>7</sub> as well. Make sure that there are five volts where there should be on the board. If all looks good, then you are ready to check the timing circuit.

Program 1 will allow you to set VRI for timing the one-shot. First, put the programmer into the test mode (see Chart 1). Then run the program. It should take as close to 20 seconds to run as you can measure. Adjust VRI until the program takes 20 seconds. If you cannot adjust the programmer to 20 seconds, then R may be changed, lower value to make it faster, higher value to slow it down.

### Applying the 25 Volts

The 8K user should read the next section before going further.

Since the 25v can be so damaging, triple check that the 25v line only runs to pin 21 of the EPROM and that the diode is in properly and works properly. Then turn the power off.

Put the EPROM in, turn the power back on, and RUN Program 2. If Program 2 ran badly, go back and check the wiring. If it ran okay, then RUN Program 3. (4K ROM apply 25v before RUNNING the program; 8K ROM, during the run.) After the program is over and the 25v are removed, run Program 4. Program 4 checks to see that your wiring has not created redundant addressing in the memory. If the program prints more than one address, then most likely an address line is open (or the

EPROM has a defective address pin), and you must go back to the previous section and dynamically check the address and data lines. If program ran okay, then you are ready to program the EPROM with real data.

Verify that when the 25v are connected to the Vpp that only 3 to 30 ma are drawn by that pin. Also, if some other 25v source is used, make sure it is well regulated to within +1v of 25v.

### Programming the EPROM

Programming is simple. Put the Eprom programmer into the program mode (Chart 1) and then POKE data into the EPROM addresses. Because of the way the 8K ROM uses the Refresh cycle, I have had trouble on occasion while the video is on. Therefore, for the 8K ROM the video must be "off" while the EPROM programmer is in the program mode. Program 5 is used for the 8K ROM. Do not have the 25v on when the 8K ROM video is

### Program 7. Entering Hexadecimal Data.

```
10 FOR L=0 TO 10
20 PRINT L:
30 INPUT I$
40 PRINT I$
50 POKE L+M,USR N
60 NEXT L
```

Note: M = first address to which data is to be POKEd. N = address of Program 6 in the EPROM. This program cannot be used to POKE into the EPROM.

on, or else bad data may be written into the EPROM. Line 5 of the program is a loop which waits for the "P" key to be pressed. While the program is waiting, you must set the EPROM programmer to the "program" mode. Then press "P" and the program will POKE the data into the EPROM. You will know that the programming is done when the screen starts to glitter with garbage as the program gets SAVED in line 1000. Now place the EPROMer into the "read" mode. Then press BREAK.

Two sample programs are shown which work for the 4K Basic. One converts a hexadecimal string into a number (Program 6). The other program converts a number into a hexadecimal representation which can be PRINTed (Program 8). Programs 7 and 9 show their uses in Basic programs.

#### Putting It to Work

This construction project is really an open ended affair, just as computers are. Once operating, your limits are your imagination, patience, and money. Though not particularly difficult to build, like all projects it will take fortitude to keep on going when things look hopeless (and they will).

Published programs should be checked to see if any changes must be made when relocating them to the EPROM addresses. Relative jumps and calls to inside the program have to be changed. An example of one particular problem is illustrated by trying to adapt the

#### Program 8. A Machine Language Program to be POKEd into the EPROM.

```
LD HL,(VARS)      ;Load HL with location of first Variable.
                   ;Variable must be there from BASIC
                   ;program and must be a one letter name.
                   ;Get past variable name.

INC HL
LD A, (HL)
LD B, A
AND A, 0Fh         ;Mask last four bits
ADD A, 28          ;Convert to number token
LD HL, (E-file)    ;Load HL with the address of the end of
                   ;the variable list. A two character
                   ;string must be there from the BASIC
                   ;program.

DEC HL
DEC HL
DEC HL
LD (HL), A
DEC HL
LD B, A
AND A, 0Fh
RR
RR
RR
RR
ADD A, 28          ;Convert to number token.
LD (HL), A         ;Place in upper character of string.
LD HL, 0000        ;Clear HL just for neatness' sake.
RET               ;Return to BASIC with the last string
                   ;being a hexadecimal representation
                   ;of the number in the first variable.
                   ;Note: Only numbers 0 to 255 are converted.
```

"Scroll" routine of Logan (SYNC 1:4). The routine requires three bytes of RAM, one to pass the "Leave" parameter, the other two for internal program register. The addresses of the RAM bytes were immediately before the subroutine. Obviously, an EPROM can not be used for RAM. My solution was to pass the "Leave" parameter through the RANDOM-ISE command and use the Syntax pointer location for the INTERNAL PROGRAM register since no Syntax pointing is required during the subroutine.

There have been many good subroutines in SYNC and the general techniques outlined in such articles can be used as long as they are not used blindly but understood and modified as needed. A good book on Z80 machine language programming will help a great deal.

A log of the addresses should be kept so that you know where what is and that you do not over write onto existing programs. Also tape copies of all programs should be kept in case it becomes necessary to reprogram the whole EPROM.

I have run my programmer with the power supply provided with the computer. However, when I started to add other devices, it quickly became necessary to supplement the power supply. If your system is already taxing the power supply, you will have to consider expanding it.

#### Construction Outline

- 1) Gather parts into one place and fit them into the PC board. Use the IC socket for the EPROM.
- 2) Solder the circuit together.
- 3) Test the board for proper connections.
- 4) Check and adjust the timing resistor. Check the 25v line.
- 5) Place the EPROM in and test it with the various programs (2 through 4).
- 6) If it is okay, program in some simple routines and see if they work.

#### A Cheap and Simple EPROM Programmer (3:1)

The author asks to have added at the end of the section "How the EPROM Programmer Works," p. 80, the following paragraph:

As designed, the EPROM programmer will not work with 64K memory modules. The reason is that they generate their own ROM C/S signals which would conflict with those generated by the programmer. However, once programmed, the EPROM could be placed into a ROM socket, provided that the pin configuration is compatible or is made compatible. The problem here is that no one EPROM pin assignment scheme exists. To make a "standard" ROM socket compatible with the EPROM, the following modifications to the ROM circuit (not the programmer) are required: traces to pins 18 and 20 should be reversed. The trace to pin 21 should be cut and pin 21 should be tied to Vcc (+5V). (Note: I have reversed the usual assignments of pins 19 and 20 to aid in compatibility.) In all probability, the ROM circuit provided would require such modifications.

#### Program 9. Display of Data as Hexadecimal Numbers.

```
5 LET X=0
10 FOR L=0 TO 10
20 LET X=PEEK (L+M)
30 LET Y=X/16
40 LET X=X-16
50 PRINT L;"-";Y;X;
60 NEXT L
```

Note: Line 5 reserves the first variable in the variable list for the subroutine. This must be done before the FOR command sets up its variable. The FOR variable cannot be used for the first variable, nor can variables with more than one character in the name. Line 30 makes sure that there is a two character string at the end of the variables list. M = first address of the area to be displayed. N = address of Program 8 in the EPROM.

#### Decimal Listing for Program 8.

0-42	1-8	2-64	3-35	4-126
5-71	6-230	7-15	8-198	9-28

# LARKEN SYSTEM

## DISK DRIVE MENU LOADER

### EASY TO USE AND CONVEIENT

Just place the highlighted bar on the program name you wish to load. This program uses the CAT feature to assemble the list of the programs to load. It can handle 100 titles, and you can go back and forth over the entire list of names.

The program was written for L.I.S.T. (Long Island Sinclair Time) group by Keith Skapinski and is available on a 3 1/4 in. disk if you prefer. Order from Tom Skapinski, 7 Atkinson Lane, Coram, NY 11727 (Cost \$3.00).

**INSTRUCTIONS:**  
Enter the first listing then compile using Timachine by Novelsoft. Save as directed by Timachine. Name "DISKME.CO" then reload at 50000, and save as "DISKME.C1" CODE 50000,3745. Enter the second listing, the basic loader. Run; then break and goto 200 to save the two parts. I hope you enjoy using this program. Keep Computing!

```
